

Planning Assistant Application

By Dawson Matthew, BumSoo Kim, and Logan Caffey

Problem Definition

- When our lives get busy, it can become difficult to keep track of everything we have planned.
- Some plans need to be started far ahead of time
- Some plans are best split up into sub-plans to make them more manageable
- How can we best stay dedicated to goals and other less concrete tasks

Proposed Solution

- An app with a smart calendar and artificial assistant
- The calendar self organizes tasks and schedules using natural language input
- For anyone who struggles to get tasks done
- Ability to check in with the artificial assistant to receive advice about when to start working on upcoming tasks
- Integration of less concrete tasks such as goals
 - The assistant can check in on your goal progress to encourage and remind you to complete theme

System Architecture

- Frontend & Backend: SwiftUI on iOS, initiate AppData objects, and other tab objects, then make tree structures. No external backend (for now), After every CRUD operation, persist function flush the data to disk. Implement simple agent in backend in future.
- State and dataflow: Data stored at AppData, creates todos and routine, stores object as JSON format, load ICS calendar file to add school tasks.
- Service & integration: support location service for calculating travel time. Integrated OpenAI chat completions using API for chat tab.

Use of AI Tools

- We have been using multiple different AI Agents
 - Open AI Codex
 - Our favorite, most powerful and intuitive
 - Github Copilot
 - Useful but less agency than Codex
 - Google CLI
 - Less powerful than the others, our least favorite

Prototype Demo

Next Steps

- Agent-like assistant that can consistently create calendar events
- Create an interface for other mediums
 - Web application
 - Android application
- Automatically suggest and split large projects into smaller tasks
- Live Activity tracking
 - For deeper iOS and personal integration
- Sync functionality
 - Our application currently runs strictly locally, no accounts
