

# AI Task Assistant Project

## **Problem Definition – What problem are you addressing? Why is it important or interesting?**

Many people often start working on tasks too late because they forget about it until it is too late or under estimate how long it will take. This is an important problem because it affects nearly everyone in their day to day lives.

## **Proposed Solution – What's your application or system meant to do? Who is it for?**

Our application is meant to provide a natural language interface to input tasks and future projects or goals. Users are meant to check in every day and get reminders on what projects or deadlines are coming up and should start to be worked on. The user can follow up by writing down what they worked on and any new items they want the application to know about. Ideally, the application will be able to learn how long certain tasks take the user to complete and accommodate accordingly.

## **System Architecture – How does your solution work at a high level (frontend, backend, data flow, etc.)?**

Our front end will be a web application with a chat interface as well as a calendar interface. The chat interface will be for inputting new tasks or goals, that the application will use natural language processing to create calendar activities and deadlines, as well as get advice from the language model about what should be worked on next considering the scope of planned projects and the user's time needed to complete them. The calendar interface will display upcoming events in a more traditional way and the user can connect outside calendars to the application as well.

## **Use of AI Tools – How are you integrating vibe coding tools like Cursor, GitHub Copilot, Claude Code, or Windsurf?**

We are using Codex and Cursor to create this application.

## **Prototype Demo – Show an early version or demo of your system, even if it's not complete.**

A calendar with functions for adding, deleting events, drag and drop to move the date. Chat interface to communicate with AI, AI modify plans based on consumption of time, effort level. Loading Canvas calendar.

## **Next Steps – What are your goals for the second half of the semester?**

T.B.D.
